A TI-59 Calculator Program for
Computation of Schlumberger Resistivity Sounding
Curve for Models with as many as 25 Horizontal Layers

by

Ahmed Samir M. El Kahwagy

**UNIVERSITY OF UTAH
RESEARCH INSTITUTE
EARTH SCIENCE LAB.**

Open-File Report No. 81-160

This report is preliminary and has not been reviewed for conformity with the U.S. Geological Survey editorial standards. Any use of trade names is for descriptive purposes only and does not imply endorsement by the USGS.

Although this program has been extensively tested, the USGS cannot guarantee that it will give correct results in any or all particular applications.

TITLE Schlumberger Resistivity Sounding

PROGRAMMER Ahmed Samir M. El Kahwagy*

DATE 10/20/80

Partitioning (Op 17) 2,3,9,8,9

This program was developed to do rapid computation of theoretical Schlumberger resistivity sounding curves. It is based on the application of Ghosh's linear filter (Ghosh, 1971) to resistivity transforms calculated for a given earth model.

Haines and Campbell (1980) wrote a program for the computation of Schlumberger and Wenner sounding curves over structures with as many as 10 horizontal layers. Although it is generally not possible to visually recognize more than 8 layers on a field curve, the present program can be used to compute sounding curves from digitized electric logs provided the number of layers does not exceed 25.

The input data consists of the thicknesses, the resistivities, and the number of layers (up to 25). The program will compute the apparent resistivities at the rate of 6 points per logarithmic cycle starting at abscissa value of $AB/2$ of 1 and ending at 10,000. The computed apparent resistivities will be stored successively in registers 37 to 61. This represents the output of the program, and the contents of these registers can be recalled by the user.

Note: The dimensions of the computed electrode spacings ($AB/2$) and apparent resistivities will correspond to those of the entered thicknesses and resistivities, respectively.

*Work done for the USGS on a grant from Aid to International Development while on leave from the Geological Survey of Egypt.

The following is the output of computed apparent resistivities for the above-mentioned illustrating example.

Computed apparent resistivities	Stored in registers	
241.1431472	37	- for AB/2=1
217.0136337	38	
179.1268944	39	
139.846785	40

USER INSTRUCTIONS

STEP	PROCEDURE	ENTER	PRESS	DISPLAY
1	Clear memory		2nd CMs	
2	Repartition memory storage area	9	2nd Op 17	239.89
3	Load Side 1 of Card Load Side 2 of Card		INV 2nd Write	1. 2.
4	Input layer parameters: starting with the first layer, enter and store thicknesses and resistivities as shown in the following example of a 4-layer model:			
	Thickness Resistivity			
	First Layer 1 259	1.00259	STO 12	1.00259
	Second Layer 46 94	46.00094	STO 13	46.00094
	Third Layer 150 27	150.00027	STO 14	150.00027
	Fourth Layer --- 150	0.00150	STO 15	0.00150
	There are 25 available registers, from no. 12 to no. 36, for layer parameters entry.			
	The last input resistivity value represents the resistivity of the infinitely thick last layer.			

- 5 Enter number of layers (N=4 for above example) 4 4.
- 6 Press A to start program A
- 7 End of program is indicated by the display of 61

Press RCL followed by a register number from 37 to 61 to display successively the computed apparent resistivities for AB/2 of 1, 1.46, 2.15, 3.16, 4.64, 6.81, 10, 14.6,, 10000.

Operating Restriction

The values of layer resistivities should not be larger than 99999. A six digit number will be considered as a decimal fraction. Layer thicknesses can be entered up to a 4-digit number.
