Dear Mike

Here is some literature about the Digital Group systems. The system I have is like the Series 3 system 2 described in Flyer No. 12 except I have added memory (34 K total bytes), faster memory chips and a bigger power supply than is standard. I have a printer on order and am waiting for the new version of Basic that should be out soon. The one thing that the 9830 has that I don't is an x-y ~~monitor~~ plotter. There is one available in kit form but writing the software to control it would be a bear. I have also ordered a processor controlled 8 channel analog to digital, autoranging input device which will allow me to hook the computer to the real world and let me play around with some ideas I have on intelligent instrumentation. This is all progressing slowly because of the time I spend in the field.

Well I will get back to work now so will talk to you later. Hope to see you in April sometime. Take care and say hello to everyone for me

Paul
