IN REPLY  
REFER TO:

4000 (010)

February 1983

Enclosed for your review is the Arizona Strip District's Rangeland Program Summary Update for both the Shivwits and Vermillion Resource Areas. The District has completed the grazing environmental impact statements, rangeland program summaries, and the decision process for both resource areas. The Vermillion Resource Area completed its decision process 2 years ago, and the Shivwits Resource Area completed its decision process 1 year ago.

Both resource areas have accomplished much toward the goal of good public range management as proposed in the environmental impact statements and rangeland program summaries. In addition, some goals have changed in line with new rangeland management policies.

This summary will update you, as of October 1, 1982, of the above accomplishments, goals, and changes.

Sincerely,

G. William Lamb  
District Manager

**Vermillion Resource Area**

Vermillion Resource Area  
RANGELAND PROGRAM SUMMARY UPDATE - 1982

Introduction

The Arizona Strip District completed and filed the Vermillion Final Grazing Management Environmental Statement (ES) on September 27, 1979 and issued the Rangeland Management Program Summary Report on April 7, 1980. This report is an update of the Rangeland Management Program Summary Report.

After consulting with all affected parties, the Vermillion Resource Area issued all decisions and is now writing and implementing allotment management plans (AMPs) after installing rangeland improvements. This report updates the public on consultation, decisions, monitoring, AMPs, range conditions, and rangeland improvements.

Consultation

The Vermillion Resource Area consulted with several parties before issuing a proposed grazing decision: the rancher, the livestock grazing advisory board, the Arizona Game and Fish Department (AG&FD), the Arizona State Land Department (ASLD), environmental groups, and other federal agencies. The rancher and the ASLD required the most consultation. In March 1980, the resource area began contacting the ranchers involved in the decisions.

The consultation with the rancher was the most active. Resource area range specialists contacted each rancher and explained what the range survey and carrying capacity (or in the case of implemented AMPs the actual use, utilization studies, and trend) concerning his allotment. Where serious disagreements existed or if the rancher requested another range survey or double checking, the resource area did so. The rancher was invited to participate in the review of carrying capacity. Grazing systems for the allotments were negotiated at this time.

After consultations, the rancher and the area manager signed an agreement covering a new initial adjustment for the allotment, the time allowed for reaching the new numbers, and the monitoring studies to be carried out on the allotment. The agreement also included an ASLD clause, which made it clear that ASLD was determining carrying capacity of intermingled lands and that the rancher, BLM, and the ASLD would have to consult on that agency's carrying capacity figure.

In most cases, the BLM went along with the ASLD carrying capacity figures for their lands. On allotments, however, where BLM and ASLD disagreed on carrying capacity of state lands, negotiations settled the differences.

Once the rancher signed the agreement, a proposed decision was sent to the rancher and the ASLD (only where state land was involved). In a few cases ranchers didn't sign the agreements, but decisions were still issued. If National Park lands were involved, the responsible National Park Service office was notified and received a copy of the decision.

In 1979, 1980, 1981, and 1982 the Extension Service of Arizona and Utah sponsored rancher workshops with heavy BLM involvement. Grazing systems, trend methods, inventory methods, utilization methods, and animal husbandry were discussed at the workshops. The workshops also sponsored field trips and testimonies from ranchers on grazing systems. Though none of these workshops were integral to the decisionmaking process, they provided more understanding, consultation, and education for all involved.

### Decisions

The Vermillion Resource Area issued 101 decisions. All are now final. All but 14 permittees adjusted livestock numbers to their new stocking levels during the first year. Five permittees accepted a 5-year phase-in period, eight permittees accepted a 3-year phase-in period, and one accepted the reduction over a 2-year period.

Before issuing the decisions, Vermillion Resource Area had a total grazing preference of 129,852 AUMs (animal unit months). Licensed use for the 5 years before issuance of decisions was 93,446 AUMs. The active stocking level after the decisions were issued is 99,308 AUMs, a 6 percent overall increase from licensed use and a 28 percent reduction from the preference. See attachment for allotment-by-allotment analysis.

The reason the new stocking level shows a 6 percent increase from licensed use rather than a 17 percent decrease as shown in the Rangeland Management Program Summary Report of April 1980 is that grazing systems were changed. The larger decrease would have occurred if all the rest-rotation systems had been implemented as previously planned. This would mean a reduction for the rested pasture would have taken place. However, deferred systems were implemented in place of many rest-rotation systems to date, thus it was not necessary to reduce for the rested pasture. Also some rest-rotation systems have not been implemented because funding is not yet scheduled to put range improvements in place, so stocking remains at a higher level.

### Monitoring

Up to September 30, 1982, the Vermillion Resource Area has established 180 key areas on 44 allotments under the District Monitoring Plan. The Pace Frequency method is used for trend and the Grazed Class method is used for utilization. The area has 20 rain gauges established east of the Hurricane Cliffs.

When trend is established or read on an allotment or utilization studies are carried out, the responsible range conservationist contacts the rancher to invite him to participate in the studies. Actual livestock use will, and is being, gathered from ranchers on AMPs.

The Pace Frequency method of trend and the Grazed Class utilization method were developed by University of Arizona range personnel, who helped apply them

both in the Arizona Strip through a series of field meetings.

The district monitoring plan was then developed and passed around to all interested parties for comment. In November 1981 the District Monitoring Plan became final.

#### AMPs and Grazing Systems

While the ES was being prepared, the Resource Area had 12 allotments under signed AMPs, 3 of which were not fully implemented. The area now has 17 implemented intensive management AMPs and 6 less-intensive management AMPs for a total of 23 implemented AMPs. Seven allotments have partially implemented AMPs, and an additional seven have signed AMPs awaiting funds for implementation. The intensive management AMPs include a rotation grazing system with BLM-sponsored projects.

The allotments with a less-intensive AMP have no grazing systems or government-sponsored range projects. The less-intensive systems require a lower stocking rate to keep average forage utilization at or below 45 percent. Ranchers can install range improvements using their own funds.

Originally 66 intensive AMPs were to be written and implemented in the resource area. But, as each allotment designated for an AMP is reviewed it is checked with the Final Grazing Management Policy of March 5, 1982. Some allotments have been and will be changed from intensive to less-intensive and vice versa. Another reason for change is allotments change in ownership and allotments are split because owners want to be separate. These changes are made to allow the investment of government money to provide the greatest ecological and economical returns.

#### Range Conditions

Range conditions, apparent, and actual trend remain as shown in the Vermillion Proposed Grazing Management Draft ES. Actual trend studies will be updated in 1986 (some will be done earlier or later in accordance with schedules

in allotment management plans), allowing enough time and adequate readings to determine actual trends and forage utilization.

#### Rangeland Improvements

Since the decisions were issued the resource area has built 19 water catchments (80,000 gallon capacity each), four storage tanks, 32 miles of fence, 19 miles of pipeline, and one well. In addition, 1,200 acres of land treatment (burning, plowing, and seeding) have been completed. These projects were needed to implement eight AMPs, which increased total implemented AMPs to 17. Some of the projects have allowed seven other AMPs to be partially completed. The total cost of these projects as of October 1, 1982 has amounted to \$303,000 from range funds (8100 and 4322).

**Shivwits Resource Area**

**Rangeland Program Summary Update**

**1982**

## Shivwits Resource Area

### RANGELAND PROGRAM SUMMARY UPDATE - 1982

#### Introduction

The Arizona Strip District completed and filed the Shivwits Final Grazing Management Environmental Impact Statement (EIS) on July 15, 1980 and issued the Rangeland Management Program Summary Report on January 1, 1981. This report is the first update of the program summary report. The Shivwits Resource Area began issuing proposed grazing decisions on December 15, 1980, (all are now final) and is now writing and implementing allotment management plans (AMPs), establishing key areas, and installing range improvements. This report updates the public on consultation, decisions, monitoring (key areas), AMPs, range conditions, and rangeland improvements.

#### Consultation

The Shivwits Resource Area consulted with several parties during the decisionmaking process. The rancher and the Arizona State Land Department (ASLD), however, were the primary parties consulted, as they were to be most affected. Other parties, involving the full spectrum of public land users, were contacted as to their interest in the grazing decisions per allotment. Other than the rancher and the ASLD, two parties requested copies of each decision: the Sierra Club and the Arizona Game and Fish Department (AG&FD).

The consultation with the rancher was the most active. Resource area range specialists contacted each rancher and explained what the range survey (or in the case of implemented AMPs the actual use, utilization studies, and trend) concerning his allotment. If the rancher requested another range survey or double checking, the resource area did so, with the rancher present. Once the rancher and the area manager reached and signed an agreement, the proposed grazing decision was issued, showing the rancher's initial adjustment and the

time outlined in the agreement over which the adjustment was to be made. In the case where the rancher refused to sign the agreement, the BLM still issued the decision.

The resource area used ASLD carrying capacity for calculating percent federal range.

The Extension Service of Arizona and Utah sponsored rancher workshops that included BLM participation in 1979, 1980, 1981, and 1982. Grazing systems, trend methods, inventory methods, utilization methods, and animal husbandry were discussed at these workshops. The workshops also sponsored field trips and testimonies from ranchers on grazing systems. Though none of these workshops were integral to the decisionmaking process, they provided more understanding, consultation, and education for all involved.

#### Decisions

The Shivwits Resource Area issued 89 decisions. All are now final. Seventy-eight ranchers adjusted livestock numbers to their new stocking level during the first year after the decisions were issued. Eleven ranchers with sizeable reductions in livestock numbers asked for a 3- to 5-year phased-in reduction. This was done in conformance to regulations.

The AG&FD and the Sierra Club received copies of all decisions, and the ASLD, ranchers, and the National Park Service received copies of decisions involving their lands or allotments.

Before the decisions were issued, the Shivwits Resource Area had a grazing preference of 108,739 AUMs (animal unit months). Actual use for the 5 years before issuance of decisions was 83,580 AUMs. The stocking level after the decisions is 81,006 AUMs, a 4 percent reduction from actual use and a 26 percent reduction from the preference. See attachment for an allotment-by-allotment analysis.

### Monitoring

During the past year the resource area has established 223 key areas on 54 allotments designated for intense and less intense management. Custodial allotments will not have key areas. Other key areas will be established as needed.

Trend is measured by the Pace Frequency method, and utilization is determined by the Grazed Class method. Precipitation is measured at 20 sites across the area. Actual use is kept by the ranchers and submitted to the BLM. These trend and utilization methods were developed by University of Arizona range personnel, who helped apply them on the Arizona Strip District through a series of field trips and demonstrations.

A District Monitoring Plan, which was circulated to all interested parties for comment, became final in November 1981. The affected rancher is invited to participate in the establishment and reading of the monitoring studies.

### Range Conditions

Range conditions remain as shown in the Shivwits Proposed Grazing Management Draft EIS--263,802 acres in good condition, 538,745 acres in fair condition, and 1,046,348 acres in poor condition. After 5 to 10 years the monitoring studies should detect any shifts in the range condition.

### AMPs and Grazing Systems

The Shivwits Resource Area had 16 implemented intensive AMPs before any decisions were issued. Now 17 intensive AMPs and 2 less-intensive AMPs have been implemented and an additional 9 AMPs have been written and are awaiting implementation. The Rangeland Program Summary called for 40 intensive AMPs, but this number may change in compliance to the Final Grazing Management Policy issued on March 5, 1982. As each AMP is written, it is reviewed to see if it meets the criteria for intensive management, less-intensive management, or

custodial management. The scarcity of available funds will require investment in rangeland improvements that yield the greatest ecological and economical returns from the investment.

Intensive management AMPs will include rotation grazing systems with BLM-sponsored projects to aid in implementing the AMPs. The less-intensive AMPs will prescribe no grazing systems and few BLM-sponsored projects. Forage utilization under the less-intensive systems will be held to 45 percent (rather than the 50 percent under intensive management), and ranchers can build range improvements using their own funds.

#### Rangeland Improvements

The Shivwits Resource Area has accomplished the following projects since the last grazing decision was issued in September 1981:

1. One 35,000-gallon catchment
2. Three 80,000-gallon catchments
3. 9.3 miles of fence (approximate)
4. 2,050 acres of land treatment

Three catchments and 1.5 miles of fence went toward implementing new AMPs. The remainder helped complete implementation of the 16 existing AMPs. As of September 27, 1982 these projects have cost approximately \$190,000 from range funds (4322 and 8100).
