SUBJECT: NOQUEZ PROSPECT TEMPERATURE LOGS

TO: FRANK DELLECHAIE

FROM: GARRY MAURATH AND WILLIAM TEPLow

DATE: APRIL 16, 1982

The following list summarizes pertinent temperature, lithologic and heat flow information on the seven gradient observation holes drilled on the Noquez prospect in April, 1982.

Hole: NZ-1A

date completed: 9:00 A.M., April 13, 1982

date logged: 6:15 A.M., April 15, 1982

Lithology: 0-12' Qal; 12-35' vesicular basalt; 35-50' medium gray, fine grained andesite tuff (minor biotite); 50-60' light reddish brown rhyo-dacitic welded tuff; 60-85' light gray rhyo-dacitic welded tuff with abundant quartz phenocrysts; 85-290' light pink very fine grained, densely welded dacitic tuff with abundant biotite (same as NZ-50); 290-300' well indurated, medium gray, silicified siltstone.

BHT: 20.03°C @ 92m

65-92m ΔT = 104°C/km, k = 5 TCU, q = 5.2 HFU

Hole: NZ-5

date completed: April 4, 1982

date logged: April 14, 1982

lithology: 0-145' mafic volcanic breccia, poorly consolidated

BHT: 15.32°C @ 31.8m

Due to extensive ground water movement, no reliable heat flow measurement could be made.

Hole: NZ-13

date completed: March 30, 1982

date logged: 1:30 P.M., April 12, 1982

lithology: 0-125' Quaternary vesicular olivine basalt, highly fractured.

BHT: 20.05°C @ 34m

28-34m ΔT = 173°C/km, k = 6 TCU, q = 10.4 HFU (?)

The gradient indicates shallow ground water influence

Noquez Prospect Temperature Logs
page 2
April 16, 1982

Hole: NZ-50

date completed: April 2, 1982

date logged: 7:15 A.M., April 14, 1982

lithology: 0-6' Qal; 6-290' Dacitic welded ash flow tuff, pink very dense, non-vesicular, euhedral biotite (1%), quartz (5%), oxidized magnetite - 330-365' - unconsolidated light gray very fine grained ash - floury texture.

BHT: 20.13°C @ 110m

98-110m ΔT = 109°C/km, k = 3 TCU, q = 3.3 HFU

46-96m ΔT = 59°C/km, k = 5.5 TCU, q = 3.2 HFU

16-42m ΔT = 78°C/km, k = 4.5 TCU, q = 3.5 HFU

Hole: NZ-14

date completed: April 5, 1982

date logged: 11:30 A.M., April 13, 1982

lithology: 0-65' unconsolidated basaltic airfall lithic tuff (30% basalt frag., 70% silt and clay), 125-130' low density ash bed; 130 - 160' same as 65-125'; 160-185' non-vesicular olivine basalt (dry); 185-205' unconsolidated airfall lithic basaltic tuff (30% clay); 205-230' non-vesicular olivine basalt; 230-285' unconsolidated lithic tuff; 285-305' non-vesicular olivine basalt.

BHT: 20.12°C @ 90m

76-90m ΔT = 107°C/km, k = 2.0 TCU, q = 2.1 HFU

44-76m ΔT = 79°C/km, k = 2.9 TCU, q = 2.3 HFU

Hole: NZ-6

date completed: April 3, 1982

date logged: 9:15 A.M., April 14, 1982

lithology: 0-65' decomposed dacite tuff; 65-125' large dacite shards (2-3cm), may be fault zone, dense non-vesicular quartz biotite dacite; 125-250' dacite, pink, may be welded ash flow tuff as in NZ-50; 185-225' fault zone.

BHT: 22.40°C @ 63m

fault zone 60-63m T = 67°C/km; k = ? q = ?

20-54m ΔT = 137°C/km, k = 3 TCU, q = 4.1 HFU

Hole: NZ-8

date completed: April 5, 1982

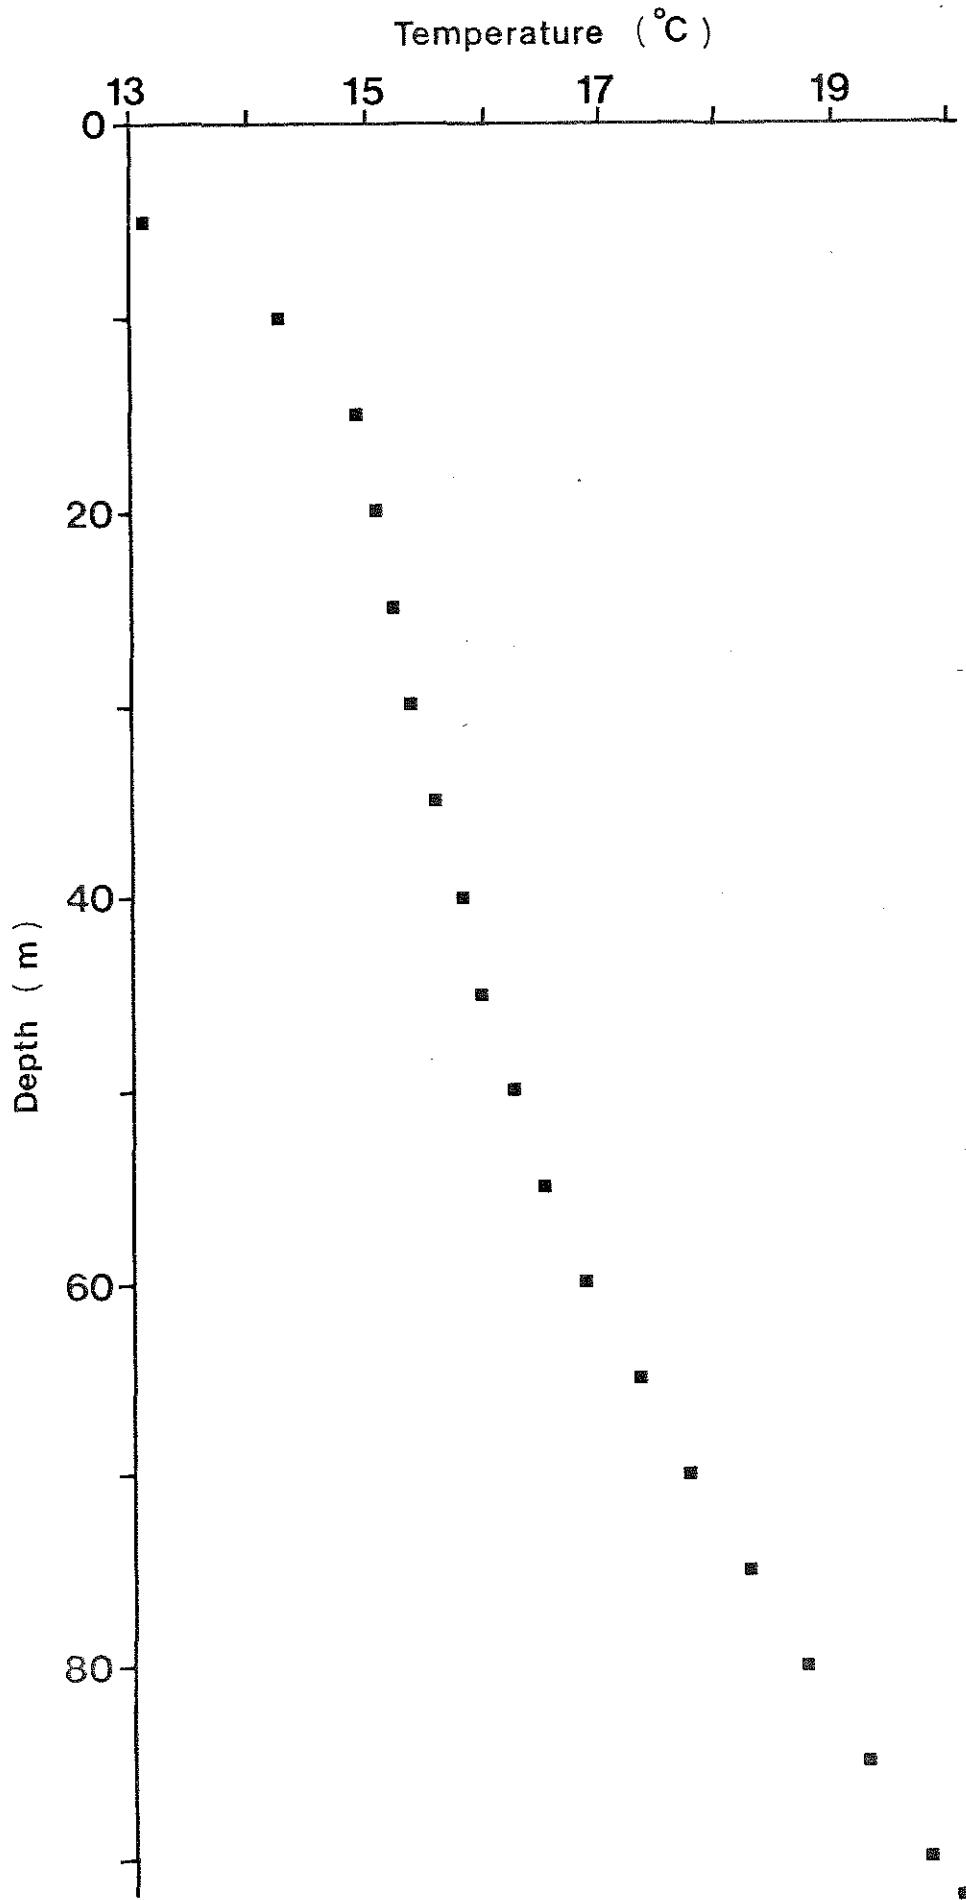

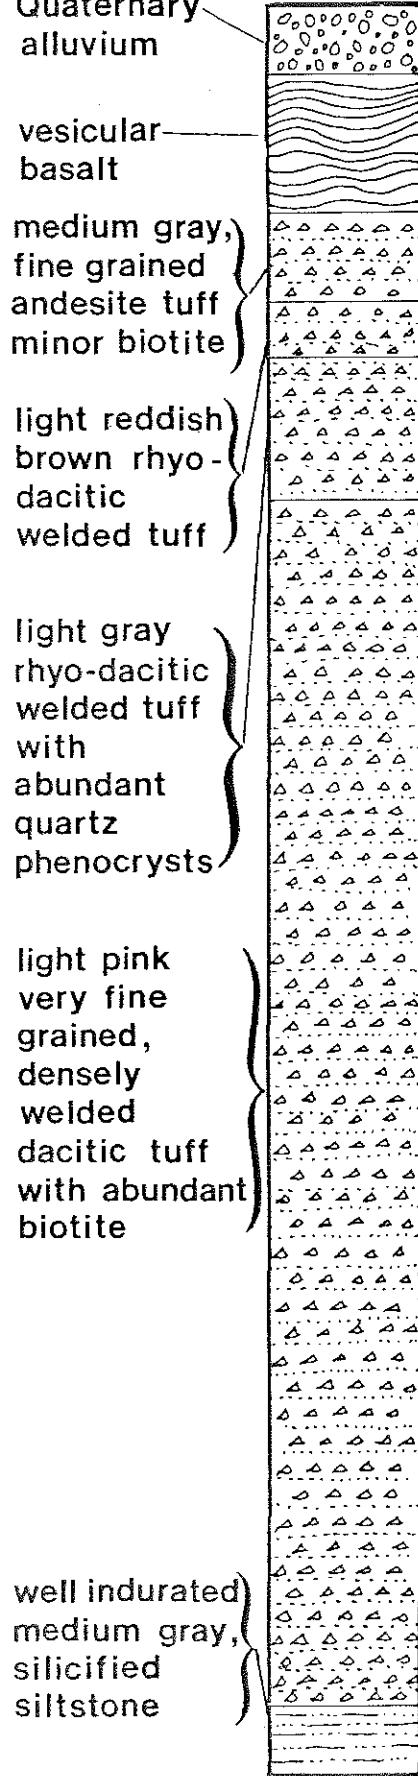

date logged: 3:30 P.M., April 12, 1982

lithology: 0-25' Qal; 25-305' dark gray laminated shale alternating with occasional buff shale, graptolitic.

BHT: 17.11°C @ 90m

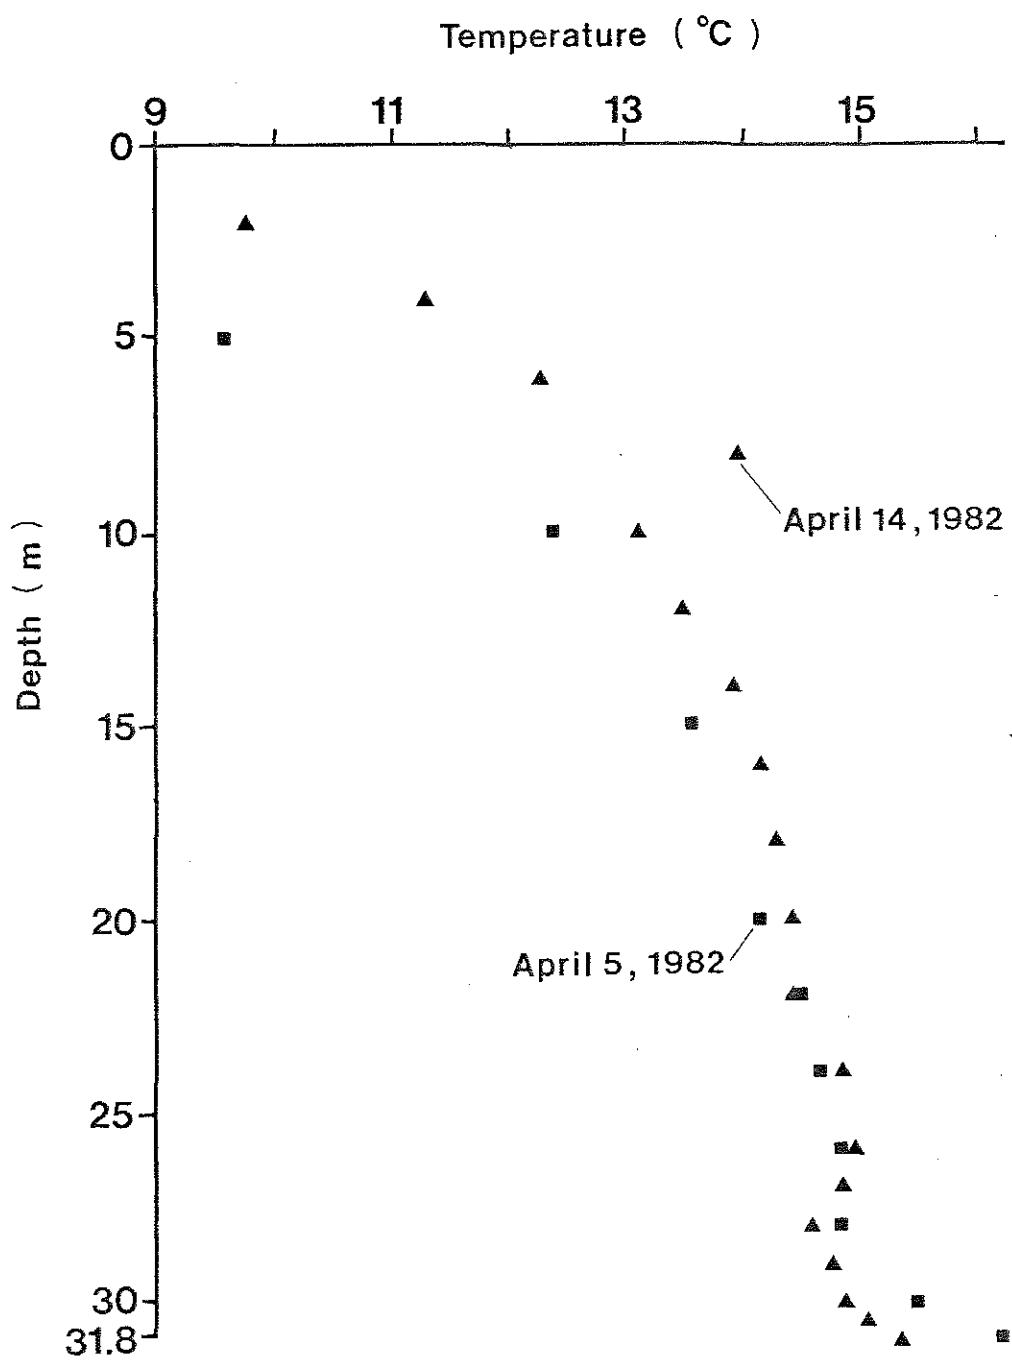

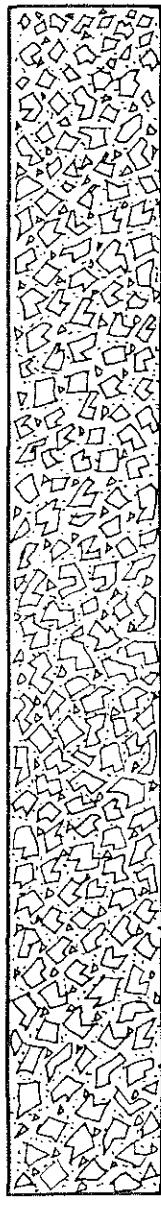

50-90m ΔT = 45°C/km, k = 4 TCU, q = 1.8 HFU

25-50m ΔT = 50°C/km, k = 3.8 TCU, q = 1.9 HFU

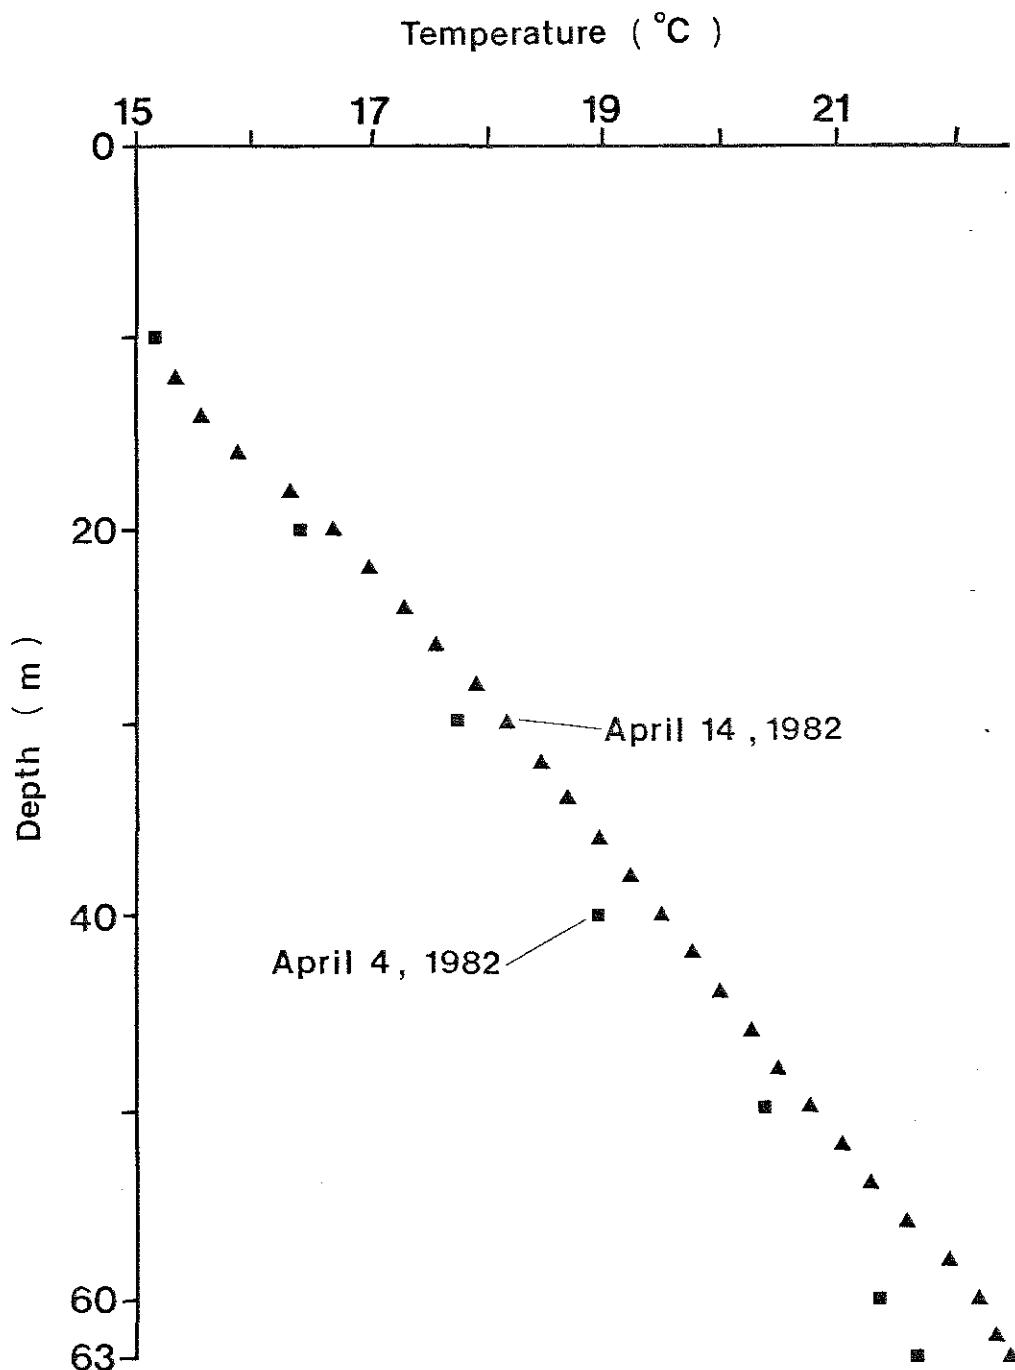

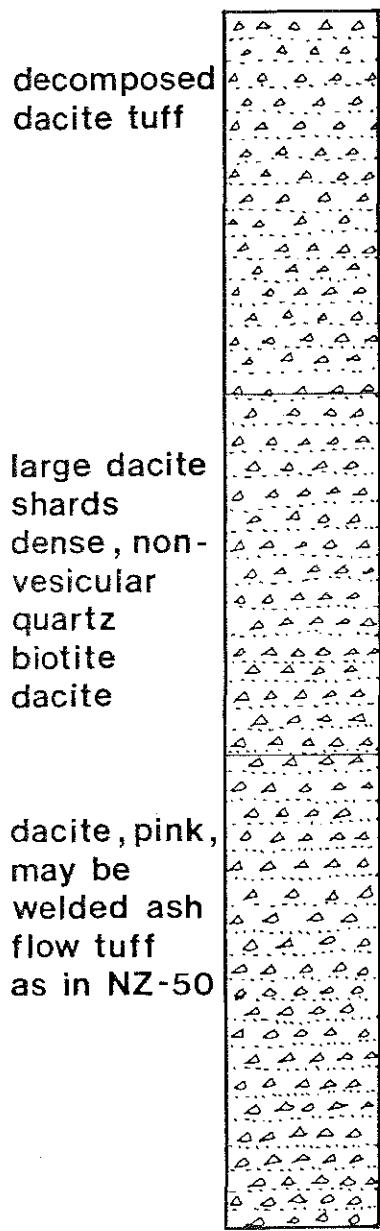

Lithologic Log and Thermal Gradient Curve Hole NZ-1A
Noquez Prospect, Mineral County, Nevada.
 $65 - 92 \text{ m } \Delta T = 104 \text{ } ^{\circ}\text{C}/\text{km}$, $k = 5 \text{ TCU}$, $q = 5.2 \text{ HFU}$
