

Surface Template

- create well tops
 - Insert → well top
 - import .txt files
 - file type → well top

Boundary - make polygon

Utilities

→ create/edit polygon

→ make edit surface

→ input (well top)

→ attribute = z

→ suggested settings

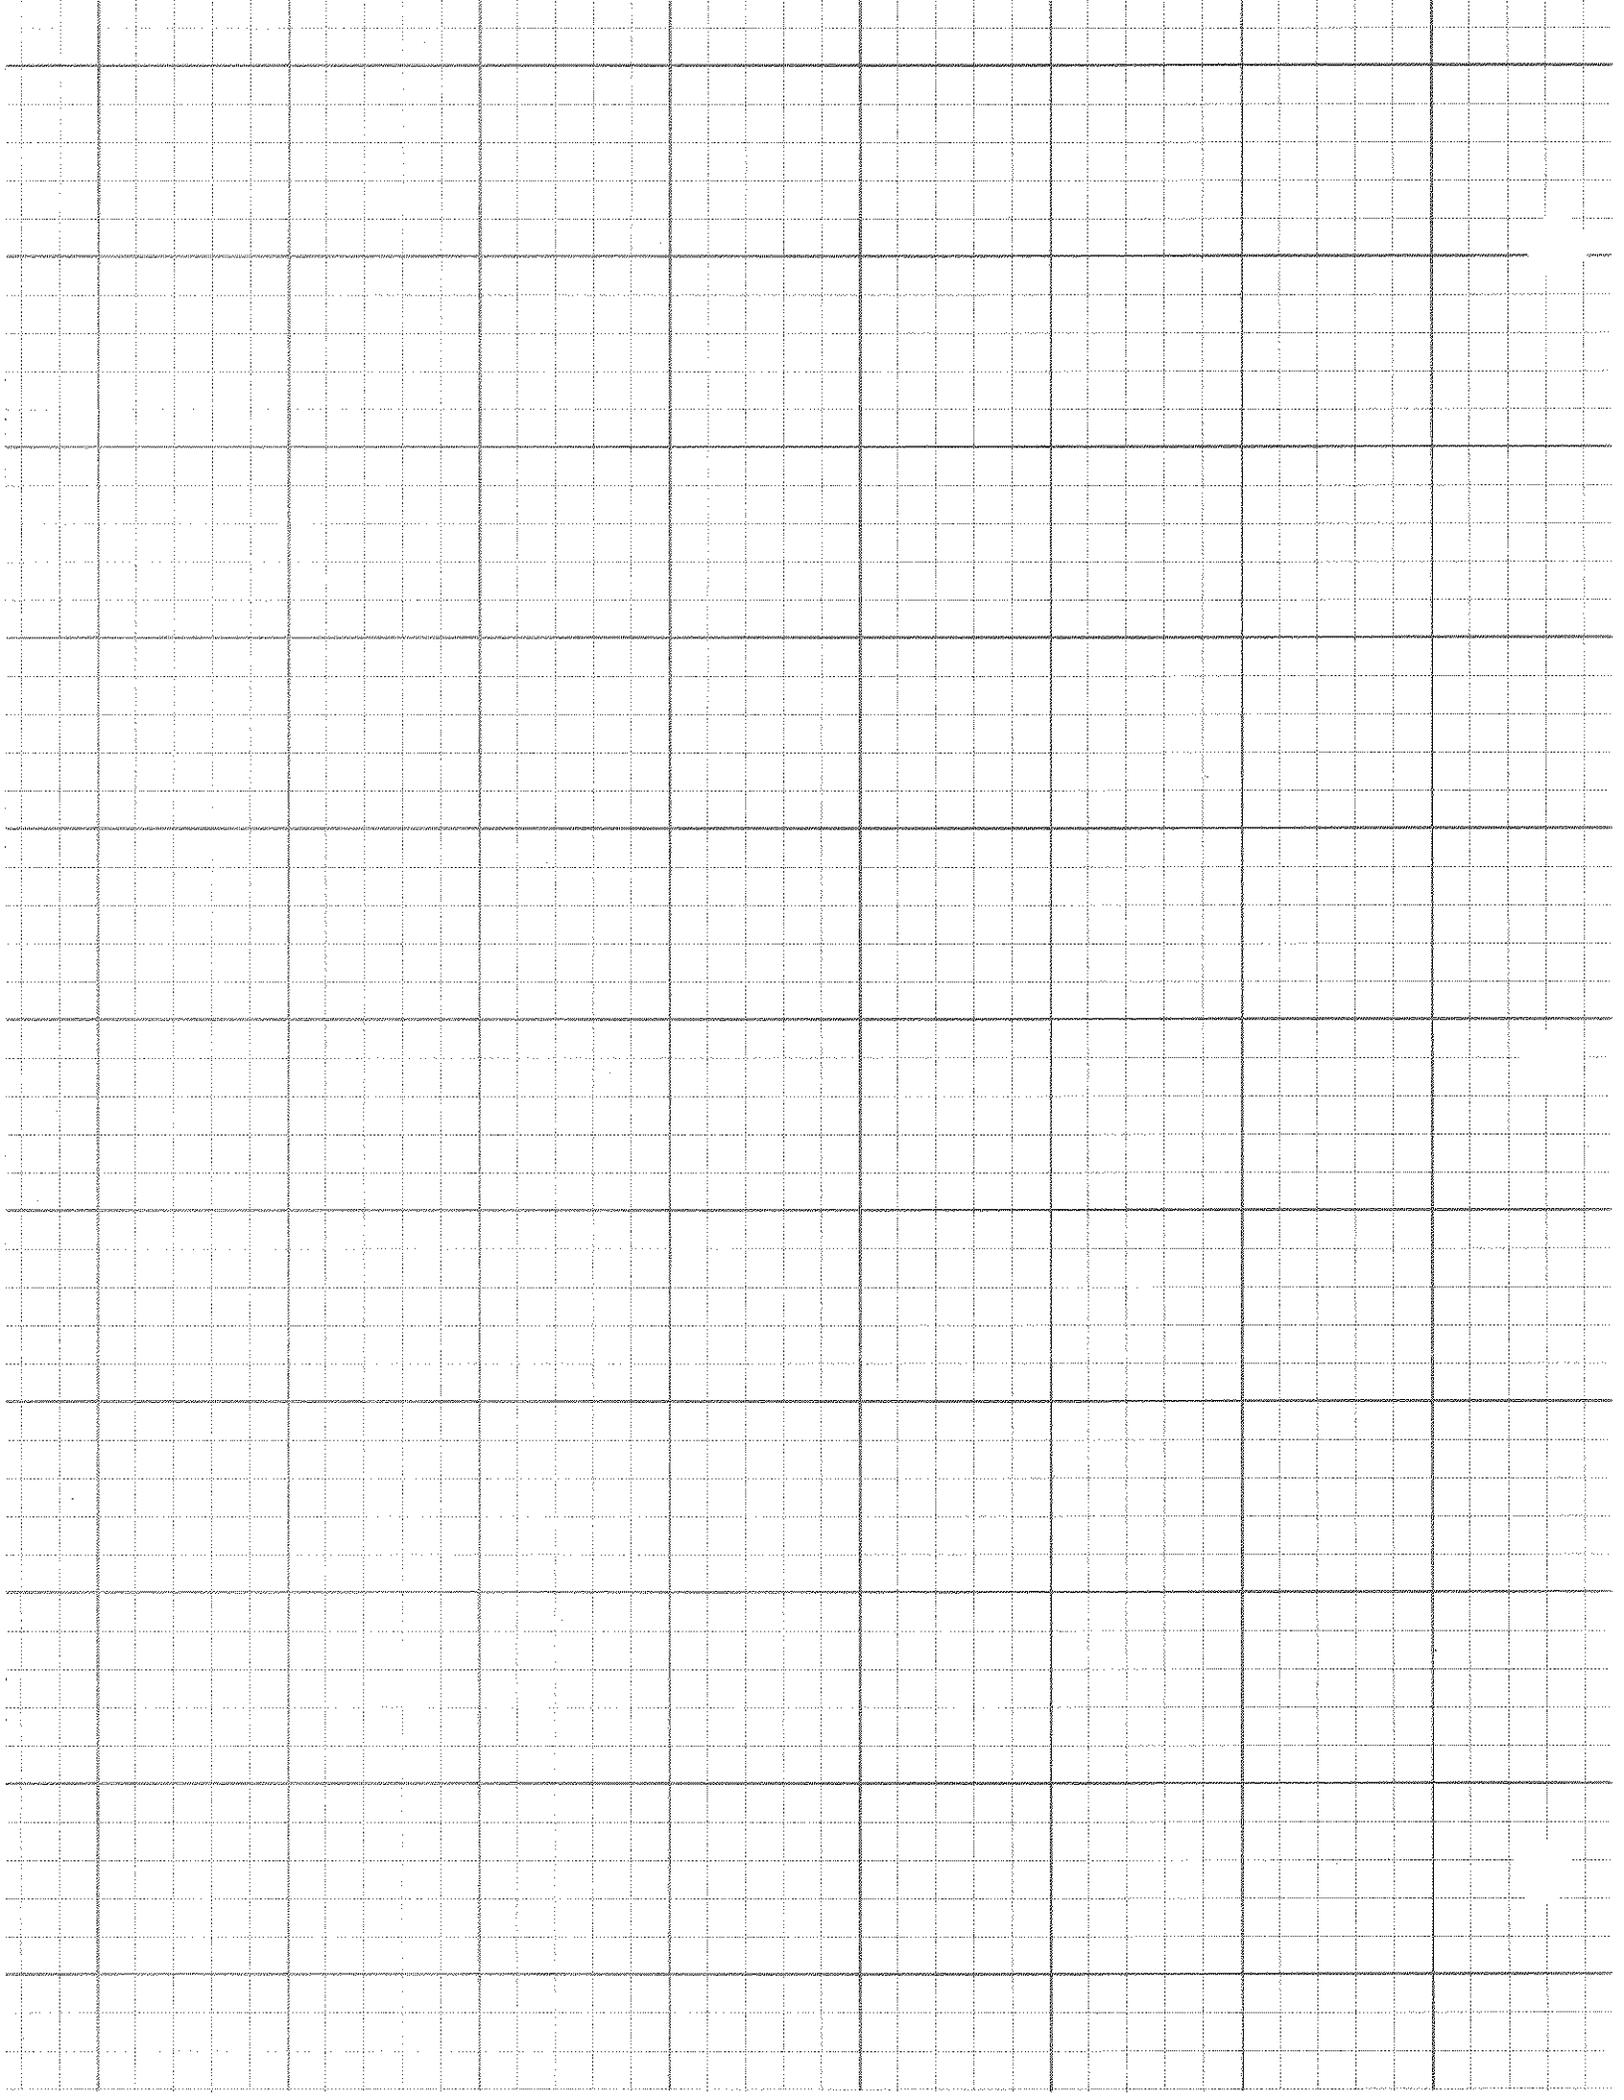

geometry tab

→ low density well tops

→ make boundary firm + extend

algorithm

→ convergent

88-28
-detailed
logging

The data package includes more than 17,500 m of core and cuttings, the results of downhole surveys (pressure, temperature, spinner data), well test data, geochemical analyses (chemical and isotopic analyses of fluids and rocks, soil gas surveys), results of geophysical surveys (MT, resistivity, TEM, gravity surveys) and geologic data (results of geologic mapping, age dating, lithologic, mineralogic and fluid inclusion investigations of cuttings and core). These data were collected primarily by Union Oil Co., Phillips Petroleum Co., CalEnergy Co., Calpine Corp. and the USGS. They represent a very significant investment by the geothermal industry. EGI researchers have already obtained the well samples and a significant amount of the chemical and geologic data. This data package represents one of the most complete data sets on a volcanic system ever made available to DOE researchers.

Mineralogy ✓ - XRD lab here
rock types ~~new~~ - core samples Jeff
temp - need PTS logs
well data - X, Y, Z
resist. - broad
geologic map - USGS, DEM
- search maps

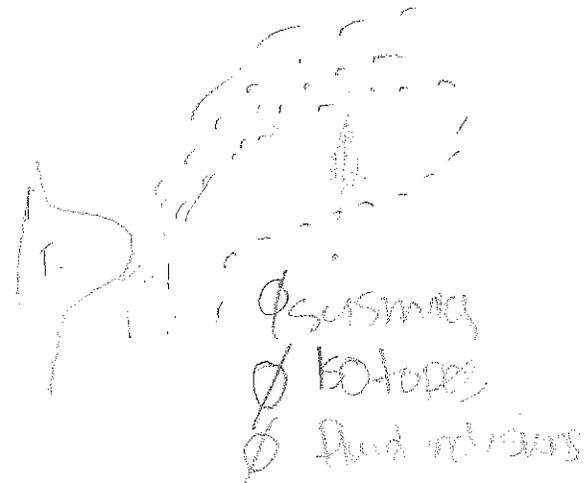

Fracture data ? (from coreholes
- how many is good sample surface maps)
gravity

geochem ?

production wells - GMY
- Telephone flat (SE lake)
- some
- which wells dried

geophysical
cored logs

- who
- when
- where samples

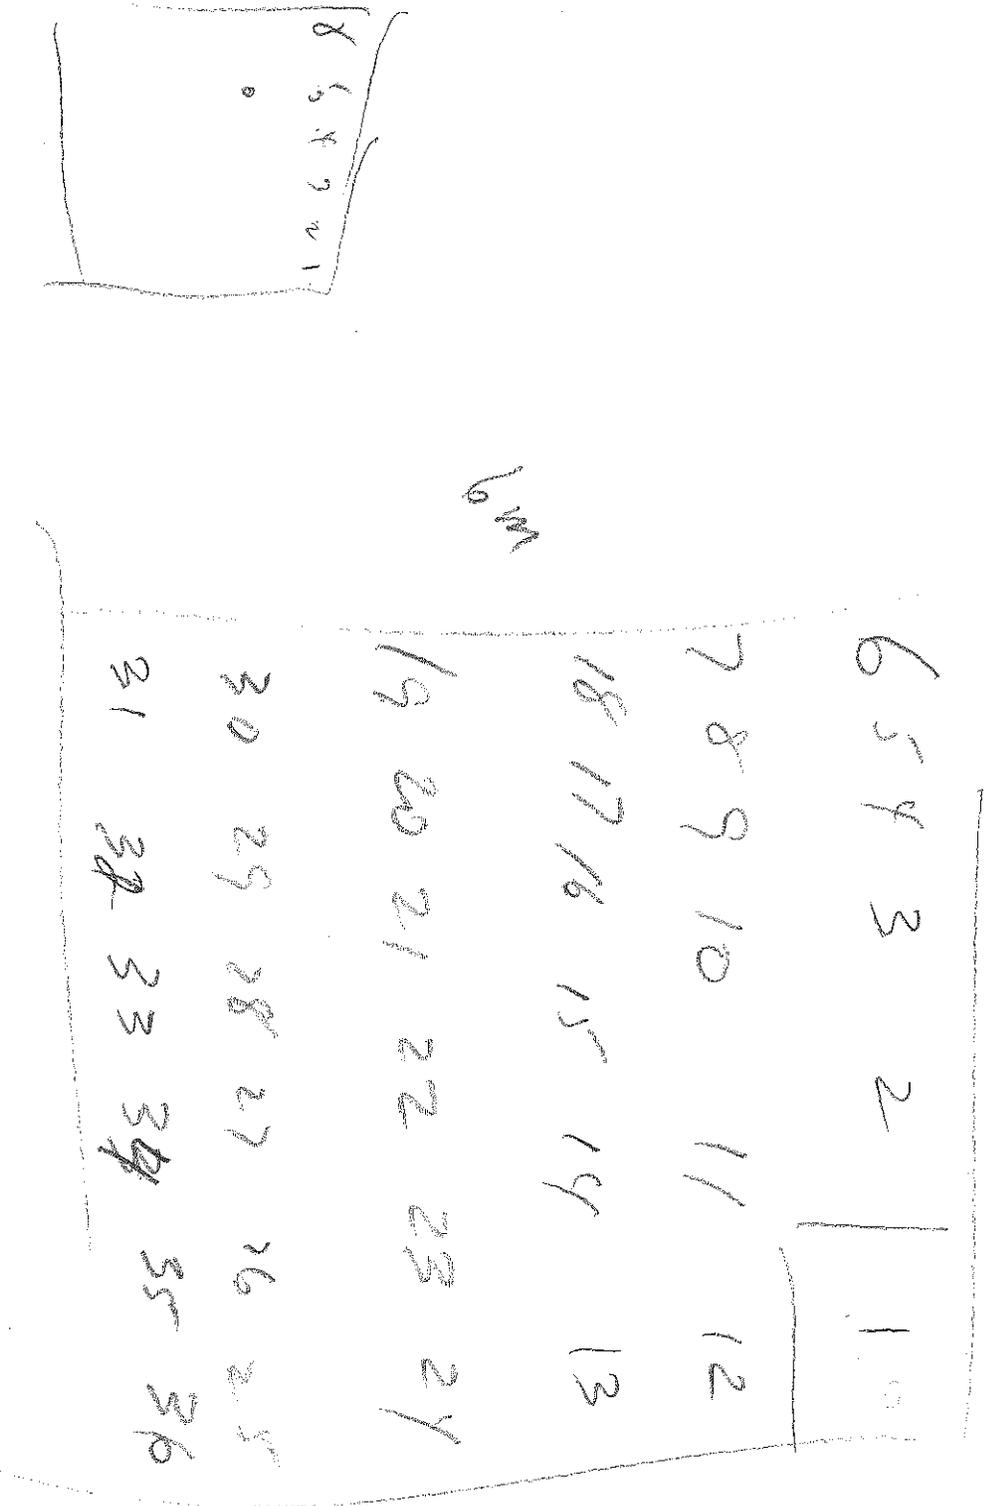

Medicine Lake
