

LITHOLOGIC INDICATIONS FROM LOGS ON RRGE #2

	Resistivity	G.R.	Cal.	ρ_{sp}	% ONL ss	sec/ft
Narrows (Schist?) Transition Zone (4665-4755)	Low values to saturation Pyrite is conductive	125- 250 APIU	Smooth but enlarged	2.75 ave.	5-12% 7% ave.	60 sec/ft ave.
Elba Quartzite (4755-4988)	200-1500 $\mu\text{m}^2/\text{m}$ Pyrite may be clue to lower resistivities	75 ave 30 min 200 max	Usual Guage	2.65 ave.	0-1% 5% max.	55 sec/ft ave.
Quartz Monz. (4988-5690) and (5760-T.D.)	Saturated @ 1500 $\mu\text{m}^2/\text{m}$	Sat. @ 340 APIU	Guage	2.55- 2.60	1-2%	52 sec/ft
Schist (5690-5760)	Saturated @ 1500 $\mu\text{m}^2/\text{m}$	25-30 APIU	Guage	2.95- 3.00 gms/cc	12-13%	50 sec/ft
Sand, Siltstone, Shale & Tuff above the Narrows	5-50 $\mu\text{m}^2/\text{m}$ averages 10 $\mu\text{m}^2/\text{m}$ in consistent sections of hole	75-200 APIU	Irreg- ular	2.20- 2.60 gms/cc	3-30%	60 to 100 sec/ft

POROSITY AND LITHOLOGY DETERMINATION FROM SONIC LOG AND COMPENSATED NEUTRON LOG (CNL)

M-N PLOT FOR MINERAL IDENTIFICATION

This crossplot may be used to help identify mineral mixtures from Sonic, Density, and Neutron Logs. (The Neutron Log used in the above chart is the SNP.) Except in gas-bearing formations, M and N are practically independent of porosity. They are defined as:

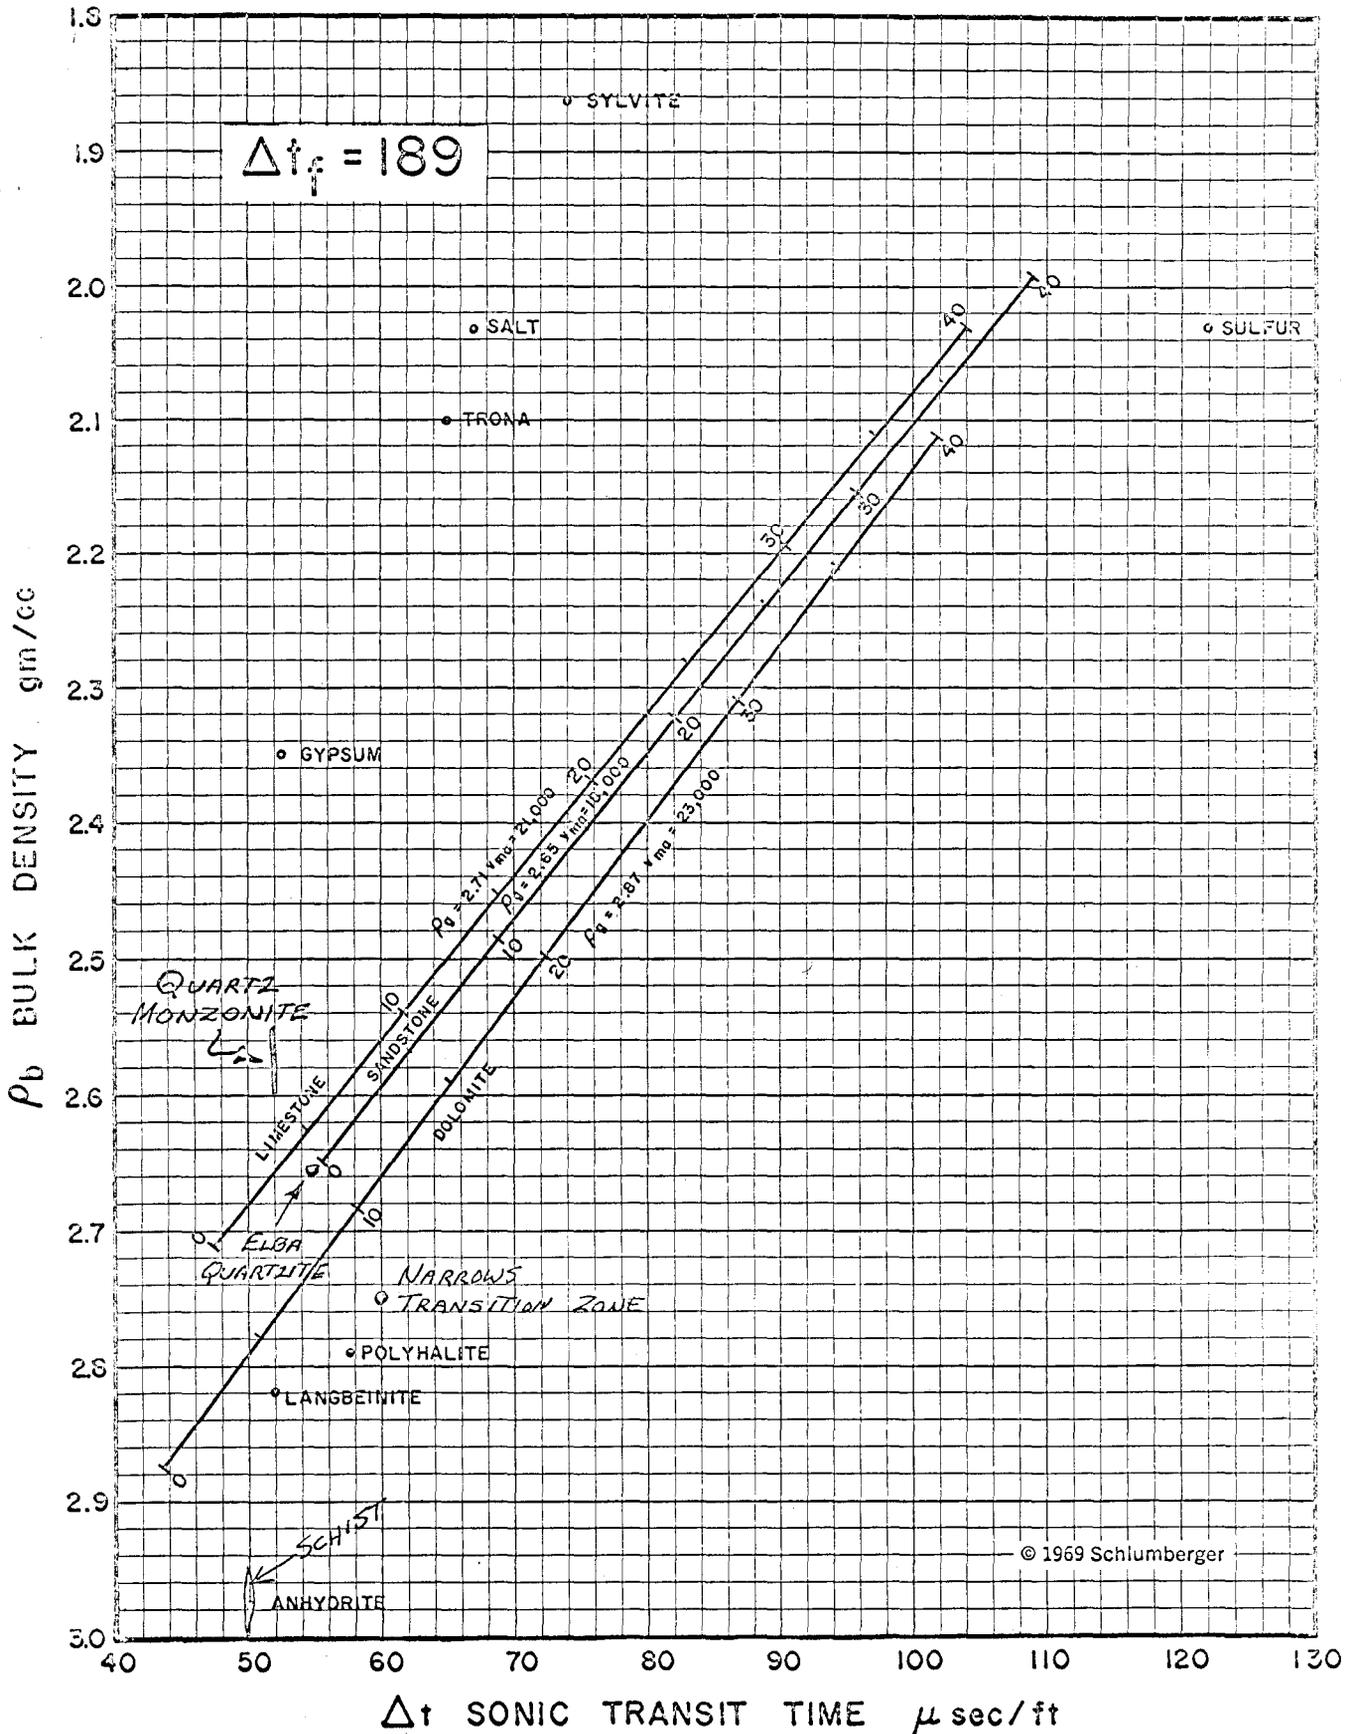

$$M = \frac{\Delta t_r - \Delta t}{\rho_b - \rho_r} \times .01$$

$$N = \frac{(\phi_N)_r - \phi_N}{\rho_b - \rho_r}$$

Points for binary mixtures plot along a line connecting the two mineral points. Ternary mixtures plot within the triangle defined by the three constituent minerals. The effect of gas, shaliness, or secondary porosity is to shift data points in the directions shown by the arrows.

Instructions for the use of this chart are found in "The Litho-Porosity Crossplot" by Burke, Campbell and Schmidt, presented at SPWLA Logging Symposium, 1969. See also Schlumberger Log Interpretation, Vol. I—Principles, 1972.
